

Problem:my nodes sometimes loosing internet connection but dont close.I close 1 node and restart it from cmd ,then the others begin sync also. In the picture 4 nodes and only node2 i did never restart it always joined.Now i see that node 2 is only connected to around 200 peers and the others around 400.Also the sync goes weird after restartng.The first minutes it goes quick but then i slows down dramaticly.Restart the slow sync node again speeds up the syncing.Is there a solution to auto start a node after connection faillure?
